# Use Cases for the The story

1. Create a Heron module
2. Record the history how users use this applications
3. Change the user name in the db.

# Heron module

◈ Create a Heron module (**Heron.py**) with a function calculate the valid inputs of lengths of 3 sides, a, b, c.

◈ Create a **testHeron.py** to test the function in the module

[https://en.wikipedia.org/wiki/Heron%27s_formula](https://en.wikipedia.org/wiki/Heron%27s_formula)

Heron.py

```
8    import math
9
10   # create a Heron function
11   def Heron_triangle_area(sides):
12       """
13       calculate triangle area
14       attributes: a iterable set [a, b, c] or (a, b, c)
15                   of non zero and positive value
16       return: triangle area
17       """
18       # Implement the logic to check the validity of code in the future
19       a = sides[0]
20       b = sides[1]
21       c = sides[2]
22       s = (a + b + c) / 2
23       A_square = s * (s - a) * (s - b) * (s - c)
24       A = None
25       if A_square > 0:
26           A = math.sqrt(A_square)
27       else:
28           print(f"The inputs {sides} cannot form a triangle.")
29       return A
```

Heron's formula states that the area of a triangle whose sides have lengths $a$, $b$, and $c$ is

$$A = \sqrt{s(s-a)(s-b)(s-c)},$$

where $s$ is the semi-perimeter of the triangle; that is,

$$s = \frac{a+b+c}{2}.[2]$$

Let $\triangle ABC$ be the triangle with sides $a = 4$, $b = 13$ and $c = 15$. The semiperimeter is $s = \frac{1}{2}(a+b+c) = \frac{1}{2}(4+13+15) = 16$, and the area is

$$A = \sqrt{s(s-a)(s-b)(s-c)} = \sqrt{16 \cdot (16-4) \cdot (16-13) \cdot (16-15)}$$
$$= \sqrt{16 \cdot 12 \cdot 3 \cdot 1} = \sqrt{576} = 24.$$

In this example, the side lengths and area are all integers, making it a Heronian triangle. However, Heron's formula works equally well in cases where one or all of these numbers is not an integer.

```
8    # testHeron.py
9    # test the function in Heron module
10   from Heron import Heron_triagle_area
11   test = Heron_triagle_area([4, 13, 15])
12   print("The expected result should be 24: ", test)
13
14   test1 = Heron_triagle_area((0, 1, 15))
15   print("error?: ", test1)
```

```
PS D:\_0SUSS\ANL251Python\MyCode\L4> python testHeron.py
The expected result should be 24:  24.0
The inputs (0, 1, 15) cannot form a triangle.
error?:  None
```

# Record the history how users use this application

## queryAndRecord.py

```python
 7   from Heron import Heron_triagle_area
 8   import datetime
 9
10   print("Welcome")
11   user_name = input("What is your name? ")
12   a = float(input("input a positive number for side 1 : "))
13   b = float(input("input a positive number for side 2 : "))
14   c = float(input("input a positive number for side 3 : "))
15   submit_time = str(datetime.datetime.now())
16
17   area = Heron_triagle_area([a, b, c])
18
19   print("The area is ", area)
20   print("Bye!")
21
22   # keep record
23   record = user_name +" " + str(submit_time) + " " \
24           + str([a, b, c]) + " " + str(area) + "\n"
25
26   file = open("log.txt","a")
27   file.write(record)
28
29   file.close()
```
